Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

・ロト・日本・モート モー うへぐ

Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

For  $\lambda \in X_{af}$ , the extremal weight module of extremal weight  $\lambda$  over  $U_q(\mathfrak{g}_{af})$ :  $V(\lambda)$ , generated by  $v_{\lambda}$  (of weight  $\lambda$ ).

Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

For  $\lambda \in X_{af}$ , the extremal weight module of extremal weight  $\lambda$  over  $U_q(\mathfrak{g}_{af})$ :  $V(\lambda)$ , generated by  $v_{\lambda}$  (of weight  $\lambda$ ).

Remark. For  $\lambda$  of positive or negative level,  $V(\lambda)$  is the corresponding integrable highest (resp. lowest) weight module.

Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

For  $\lambda \in X_{af}$ , the extremal weight module of extremal weight  $\lambda$  over  $U_q(\mathfrak{g}_{af})$ :  $V(\lambda)$ , generated by  $v_{\lambda}$  (of weight  $\lambda$ ).

Remark. For  $\lambda$  of positive or negative level,  $V(\lambda)$  is the corresponding integrable highest (resp. lowest) weight module. For level 0 its structure is much more complicated.

Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

For  $\lambda \in X_{af}$ , the extremal weight module of extremal weight  $\lambda$  over  $U_q(\mathfrak{g}_{af})$ :  $V(\lambda)$ , generated by  $v_{\lambda}$  (of weight  $\lambda$ ).

Remark. For  $\lambda$  of positive or negative level,  $V(\lambda)$  is the corresponding integrable highest (resp. lowest) weight module. For level 0 its structure is much more complicated.

For  $\lambda$  dominant integral weight of  $\mathfrak{g}$  (fixed throughout) and  $w \in W_{af}$ , the Demazure module:

$$V^\pm_w(\lambda) \coloneqq U^\pm_q(\mathfrak{g}_{\mathrm{af}}) \, {\it wv}_\lambda \, \subset \, V(\lambda) \, .$$

Affine Lie algebra  $\mathfrak{g}_{\mathrm{af}}$ , quantum group  $U_q(\mathfrak{g}_{\mathrm{af}})$ .

For  $\lambda \in X_{af}$ , the extremal weight module of extremal weight  $\lambda$  over  $U_q(\mathfrak{g}_{af})$ :  $V(\lambda)$ , generated by  $v_{\lambda}$  (of weight  $\lambda$ ).

Remark. For  $\lambda$  of positive or negative level,  $V(\lambda)$  is the corresponding integrable highest (resp. lowest) weight module. For level 0 its structure is much more complicated.

For  $\lambda$  dominant integral weight of  $\mathfrak{g}$  (fixed throughout) and  $w \in W_{af}$ , the Demazure module:

$$V^\pm_w(\lambda) := U^\pm_q(\mathfrak{g}_{\mathrm{af}}) \, {\it wv}_\lambda \, \subset \, V(\lambda) \, .$$

Remark. For  $w = w_{\circ}$  (the longest element of the finite Weyl group W),  $V_{w_{\circ}}^{+}(\lambda)$  is the global Weyl module over the current algebra  $\mathfrak{g} \otimes \mathbb{C}[x]$ .

### Background: Subquotients

A certain quotient of  $V_{w_{\circ}}^{+}(\lambda)$ :  $U_{w_{\circ}}^{+}(\lambda) := V_{w_{\circ}}^{+}(\lambda)/X_{w_{\circ}}(\lambda)$ (Beck-Nakajima).

### Background: Subquotients

A certain quotient of  $V_{w_{\circ}}^{+}(\lambda)$ :  $U_{w_{\circ}}^{+}(\lambda) := V_{w_{\circ}}^{+}(\lambda)/X_{w_{\circ}}(\lambda)$ (Beck-Nakajima).

Remarks. (1)  $U^+_{W_o}(\lambda)$  is a local Weyl module over the current algebra (unique maximal finite-dimensional quotient of a global Weyl module).

#### Background: Subquotients

A certain quotient of  $V_{w_{\circ}}^{+}(\lambda)$ :  $U_{w_{\circ}}^{+}(\lambda) := V_{w_{\circ}}^{+}(\lambda)/X_{w_{\circ}}(\lambda)$ (Beck-Nakajima).

Remarks. (1)  $U^+_{W_o}(\lambda)$  is a local Weyl module over the current algebra (unique maximal finite-dimensional quotient of a global Weyl module).

(2) For  $\lambda = \sum_{i \in I} m_i \omega_i$ , we have, as  $U_q(\mathfrak{g})$ -modules:  $U^+_{w_0}(\lambda) \simeq \bigotimes_{i \in I} (W^{i,1})^{\otimes m_i}$ ,

where  $W^{i,1}$  are the (column shape) Kirillov-Reshetikhin (KR) modules of the affine Lie algebra without the derivation (finite-dimensional, not of highest weight).

Let  $w \in W^{\lambda}$  (the lowest coset representatives modulo the stabilizer  $W_{\lambda}$  of  $\lambda$  in W).

・ロト・日本・モート モー うへぐ

Let  $w \in W^{\lambda}$  (the lowest coset representatives modulo the stabilizer  $W_{\lambda}$  of  $\lambda$  in W).

The image of the Demazure module  $V_w^+(\lambda)$  under the projection:

$$U^+_w(\lambda) := \operatorname{Im}(V^+_w(\lambda))\,, \quad V^+_{w_\circ}(\lambda) \twoheadrightarrow U^+_{w_\circ}(\lambda) := V^+_{w_\circ}(\lambda)/X_{w_\circ}(\lambda)\,.$$

Let  $w \in W^{\lambda}$  (the lowest coset representatives modulo the stabilizer  $W_{\lambda}$  of  $\lambda$  in W).

The image of the Demazure module  $V_w^+(\lambda)$  under the projection:

 $U_w^+(\lambda) := \operatorname{Im}(V_w^+(\lambda)), \quad V_{w_\circ}^+(\lambda) \twoheadrightarrow U_{w_\circ}^+(\lambda) := V_{w_\circ}^+(\lambda)/X_{w_\circ}(\lambda).$ Graded character:

$$\operatorname{gch} U^+_w(\lambda) := \sum_{\gamma \in \mathcal{Q}, \, k \in \mathbb{Z}} \dim U^+_w(\lambda)_{\lambda - \gamma + k\delta} \, x^{\lambda - \gamma} \, q^k \,, \ \ ext{where} \ q = x^\delta \,.$$

Let  $w \in W^{\lambda}$  (the lowest coset representatives modulo the stabilizer  $W_{\lambda}$  of  $\lambda$  in W).

The image of the Demazure module  $V_w^+(\lambda)$  under the projection:

 $U_w^+(\lambda) := \operatorname{Im}(V_w^+(\lambda)), \quad V_{w_\circ}^+(\lambda) \twoheadrightarrow U_{w_\circ}^+(\lambda) := V_{w_\circ}^+(\lambda)/X_{w_\circ}(\lambda).$ Graded character:

$$\operatorname{gch} U^+_w(\lambda) := \sum_{\gamma \in \mathcal{Q}, \, k \in \mathbb{Z}} \dim U^+_w(\lambda)_{\lambda - \gamma + k\delta} \, x^{\lambda - \gamma} \, q^k \,, \ \ ext{where} \ q = x^\delta \,.$$

Remark. Under the isomorphism

$$U^+_{\mathsf{w}_\circ}(\lambda)\simeq \bigotimes_{i\in I}(W^{i,1})^{\otimes m_i}\,,$$

the grading is the one by the energy function (originates in the theory of exactly solvable lattice models).

### Background: Kashiwara's crystals

Colored directed graphs encoding certain representations V of the quantum group  $U_q(\mathfrak{g})$  or  $U_q(\mathfrak{g}_{\mathrm{af}})$  as  $q \to 0$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Background: Kashiwara's crystals

Colored directed graphs encoding certain representations V of the quantum group  $U_q(\mathfrak{g})$  or  $U_q(\mathfrak{g}_{\mathrm{af}})$  as  $q \to 0$ .

The vertices correspond to the elements of a crystal basis, and the arrows to the action of the Kashiwara operators when  $q \rightarrow 0$ .

Colored directed graphs encoding certain representations V of the quantum group  $U_q(\mathfrak{g})$  or  $U_q(\mathfrak{g}_{\mathrm{af}})$  as  $q \to 0$ .

The vertices correspond to the elements of a crystal basis, and the arrows to the action of the Kashiwara operators when  $q \rightarrow 0$ .

Fact. All the above modules have crystal bases.

### Macdonald polynomials

 $\lambda:$  dominant weight for a finite root system;  $\mu:$  any weight.

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

#### Macdonald polynomials

 $\lambda:$  dominant weight for a finite root system;  $\mu:$  any weight.

 $P_{\lambda}(q, t)$ : polynomials in  $\mathbb{Q}(q, t) \otimes \mathbb{Z}[P]^{W}$ , orthogonal, generalizing the corresponding irreducible characters  $= P_{\lambda}(0, 0)$ .

#### Macdonald polynomials

 $\lambda:$  dominant weight for a finite root system;  $\mu:$  any weight.

 $P_{\lambda}(q, t)$ : polynomials in  $\mathbb{Q}(q, t) \otimes \mathbb{Z}[P]^{W}$ , orthogonal, generalizing the corresponding irreducible characters  $= P_{\lambda}(0, 0)$ .

 $E_{\mu}(q, t)$ : nonsymmetric versions.

 $\lambda:$  dominant weight for a finite root system;  $\mu:$  any weight.

 $P_{\lambda}(q, t)$ : polynomials in  $\mathbb{Q}(q, t) \otimes \mathbb{Z}[P]^{W}$ , orthogonal, generalizing the corresponding irreducible characters  $= P_{\lambda}(0, 0)$ .

 $E_{\mu}(q,t)$ : nonsymmetric versions.

 $E_{\mu}(q, t)$  defined in the double affine Hecke algebra (DAHA) setup, as common eigenfunctions of the Cherednik operators.

#### Main result

Theorem. (LNSSS) For all untwisted affine root systems and  $\lambda$  dominant, we have:

$$\operatorname{gch} U^+_w(\lambda) = E_{w\lambda}(q, t=0).$$

#### Main result

Theorem. (LNSSS) For all untwisted affine root systems and  $\lambda$  dominant, we have:

$$\operatorname{gch} U^+_w(\lambda) = E_{w\lambda}(q, t=0).$$

Remark. We have  $E_{w_{\circ}\lambda}(q, t = 0) = P_{\lambda}(q, t = 0)$ , and this can be interpreted as:

 the character of a tensor product of one-column KR modules/crystals, graded by the energy function (LNSSS, previous work);

#### Main result

Theorem. (LNSSS) For all untwisted affine root systems and  $\lambda$  dominant, we have:

$$\operatorname{gch} U^+_w(\lambda) = E_{w\lambda}(q, t=0).$$

Remark. We have  $E_{w_o\lambda}(q, t = 0) = P_{\lambda}(q, t = 0)$ , and this can be interpreted as:

- the character of a tensor product of one-column KR modules/crystals, graded by the energy function (LNSSS, previous work);
- the graded character of a local Weyl module for the current algebra (Chari-Ion, based on our work).

 quantum alcove model on the Macdonald side (we use the Ram-Yip formula, specialized by Orr-Shimozono);

Definition. Given a dominant weight  $\lambda$ , we associate with it a sequence of roots, called a  $\lambda$ -chain (many choices possible):

$$\Gamma = (\beta_1, \ldots, \beta_m).$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Definition. Given a dominant weight  $\lambda$ , we associate with it a sequence of roots, called a  $\lambda$ -chain (many choices possible):

$$\Gamma = (\beta_1, \ldots, \beta_m).$$

Fact. The construction of a  $\lambda$ -chain is based on a reduced decomposition of the translation by  $\lambda$ , as an element of the affine Weyl group. This corresponds to a sequence of alcoves.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example. Type  $A_2$ ,  $\lambda = (3, 1, 0) = 3\varepsilon_1 + \varepsilon_2$ ,  $\Gamma = ((1, 2), (1, 3), (2, 3), (1, 3), (1, 2), (1, 3)).$

Recall the graded character of the quotient module  $U^+_{w_o}(\lambda)$  (local module for current algebra) and our previous result:

$$\operatorname{\mathsf{gch}} U^+_{w_\circ}(\lambda) = \mathsf{P}_\lambda(q,t=0)$$
 .

Recall the graded character of the quotient module  $U^+_{w_o}(\lambda)$  (local module for current algebra) and our previous result:

$$\operatorname{\mathsf{gch}} U^+_{w_\circ}(\lambda) = P_\lambda(q,t=0)$$
 .

Also recall the graded character of  $V_{w_0}^+(\lambda)$  (global module for current algebra):

$$\operatorname{gch} V^+_{w_o}(\lambda) = \left(\prod_{i\in I}\prod_{r=1}^{m_i}(1-q^r)
ight)^{-1} P_\lambda(q,t=0)\,.$$

Recall the graded character of the quotient module  $U^+_{w_o}(\lambda)$  (local module for current algebra) and our previous result:

$$\operatorname{\mathsf{gch}} U^+_{w_\circ}(\lambda) = P_\lambda(q,t=0)$$
 .

Also recall the graded character of  $V_{w_0}^+(\lambda)$  (global module for current algebra):

$$\operatorname{gch} V^+_{w_{\mathrm{o}}}(\lambda) = \left(\prod_{i \in I} \prod_{r=1}^{m_i} (1-q^r)\right)^{-1} P_{\lambda}(q,t=0) \,.$$

Based on the corresponding combinatorial models, Naito-Sagaki gave a new, crystal-theoretic interpretation of the above relationship between local and global Weyl modules.

# Braverman-Finkelberg q-Whittaker functions

 $\Psi_{\lambda}(q)$ : eigenfunctions of the quantum difference Toda integrable system (Etingof, Sevostyanov).
### Braverman-Finkelberg q-Whittaker functions

 $\Psi_{\lambda}(q)$ : eigenfunctions of the quantum difference Toda integrable system (Etingof, Sevostyanov).

For 
$$\lambda = \sum_{i \in I} m_i \omega_i$$
, let $\widehat{\Psi}_\lambda(q) := \Psi_\lambda(q) \prod_{i \in I} \prod_{r=1}^{m_i} (1-q^r)$ .

### Braverman-Finkelberg *q*-Whittaker functions

 $\Psi_{\lambda}(q)$ : eigenfunctions of the quantum difference Toda integrable system (Etingof, Sevostyanov).

For 
$$\lambda = \sum_{i \in I} m_i \omega_i$$
, let $\widehat{\Psi}_\lambda(q) := \Psi_\lambda(q) \prod_{i \in I} \prod_{r=1}^{m_i} (1-q^r)$ .

Theorem. (Braverman-Finkelberg, Feigin-Makedonskyi-Orr) *In simply-laced types, we have* 

$$P_{\lambda}(q,t=0)=\widehat{\Psi}_{\lambda}(q).$$

### Braverman-Finkelberg q-Whittaker functions

 $\Psi_{\lambda}(q)$ : eigenfunctions of the quantum difference Toda integrable system (Etingof, Sevostyanov).

For 
$$\lambda = \sum_{i \in I} m_i \omega_i$$
, let $\widehat{\Psi}_\lambda(q) := \Psi_\lambda(q) \prod_{i \in I} \prod_{r=1}^{m_i} (1-q^r)$ .

Theorem. (Braverman-Finkelberg, Feigin-Makedonskyi-Orr) In simply-laced types, we have

$$P_{\lambda}(q,t=0) = \widehat{\Psi}_{\lambda}(q).$$

Remark. As we have seen before,  $\Psi_{\lambda}(q)$  and  $\widehat{\Psi}_{\lambda}(q)$  are the characters of global and local Weyl modules for current algebras, respectively.

Remark. The non-simply laced cases are notoriously hard, due to a lack of understanding of the related geometry.

Remark. The non-simply laced cases are notoriously hard, due to a lack of understanding of the related geometry.

・ロト・日本・モート モー うへぐ

Thus, for the moment, our approach based on crystal combinatorics seems to be the only option.

### Geometric connections

Flag variety G/B, Schubert variety  $X_w = \overline{B^- wB/B}$ , for  $w \in W$ .

Flag variety G/B, Schubert variety  $X_w = \overline{B^- w B/B}$ , for  $w \in W$ .

The structure constants (for multiplying Schubert classes) are the 3-point Gromov-Witten (GW) invariants.

A k-point GW invariant (of degree d) counts curves of degree d passing through k given Schubert varieties.

## Quantum *K*-theory

### Givental and Lee defined more general, K-theoretic GW invariants.

Givental and Lee defined more general, K-theoretic GW invariants.

The structure constants for the quantum K-theory QK(G/B) are defined based on the 2- and 3-point invariants (complex formula).

Theorem. (L.-Postnikov, L.-Shimozono) In K(G/B) (finite-type or Kac-Moody), we have an explicit combinatorial formula (of Chevalley type) in terms of the alcove model for expanding:

$$[\mathcal{O}_{v}] \cdot [\mathcal{O}_{s_{k}}] = \sum_{w \in W} c_{w} [\mathcal{O}_{w}].$$

Theorem. (L.-Postnikov, L.-Shimozono) In K(G/B) (finite-type or Kac-Moody), we have an explicit combinatorial formula (of Chevalley type) in terms of the alcove model for expanding:

$$[\mathcal{O}_{v}] \cdot [\mathcal{O}_{s_{k}}] = \sum_{w \in W} c_{w} [\mathcal{O}_{w}].$$

### Conjecture (L.-Postnikov)

Similar formula in QK(G/B) (finite-type), in terms of the quantum alcove model.

Theorem. (L.-Postnikov, L.-Shimozono) In K(G/B) (finite-type or Kac-Moody), we have an explicit combinatorial formula (of Chevalley type) in terms of the alcove model for expanding:
