

Q: Why don't I care about conditions on the poset P ?

Because I start with varieties. In fact, almost everything I do comes from familiar posets.

Bruhat graphs, their subgraphs, their quotient graphs

flag varieties

EG: GL_2/B

$$\begin{smallmatrix} s_1 \\ t_1-t_2 \\ e \end{smallmatrix}$$

Grassmannians

Better eq:

$X = \text{flag variety } G_n/B$

$$G/B$$

vertices

permutations w

$$w \in W$$

edges

$$(ij) w \leftrightarrow w$$

$$s_\alpha w \leftrightarrow w$$

direction

from longer to shorter in Bruhat graph

label on edge

$$t_i - t_j \text{ for } i < j$$

$$\alpha \text{ for } \alpha > 0$$

$$\begin{array}{c} s_1 s_2 s_1 \\ \parallel \\ s_1 s_2 \cdot \quad \cdot s_2 s_1 \\ | \quad \diagup \quad | \\ \diagdown \quad \diagup \\ s_1 \cdot \quad \cdot s_2 \\ | \quad \diagup \\ e \end{array}$$

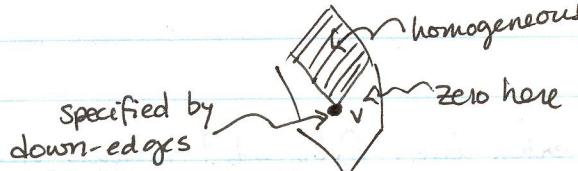

$$\begin{array}{l} = t_1 - t_3 \text{ yellow} \\ = t_2 - t_3 \text{ pink} \\ \dots = t_1 - t_2 \text{ green} \end{array}$$

Remark: In this context, the basis elements we discovered for $n=2$ are better known as Schubert classes

Intrinsic characterisation of basis elements from graph:

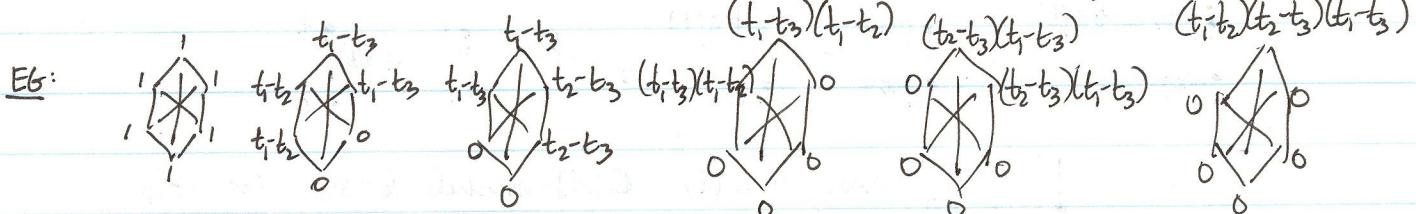

Flow-up basis $\{f_v\}_{v \in V}$ satisfies the following

$$\textcircled{1} f_v(v) = \prod_{\text{edges down from } v} (\text{label on edge})$$

$$\textcircled{2} f_v(w) = 0 \text{ if } w \notin V$$

$$\textcircled{3} \text{ else } f_v(w) \text{ is homogeneous of same degree as } f_v(v) \text{ (or zero)}$$

3. Open questions (if time, we'll do more detail on 1-2)

1. (Billey) Characterize graphs for which there is a flow-up basis, or unique flowup basis

2. Find explicit formulas for basis elements for specific families of graphs (eg: Billey for G/P)

3. Find basis for subvarieties $Y \subseteq X$, when X is known to have good basis (Manada-Tymoczko)

Knutson-Tao, Robinson, Kamnitzer
4. Equivariant Pieri rules (or LR rules): $\tau_{\square \square} \cdot \tau_{\square} = \sum c_{\square \square \square}^{\square \square} \tau_{\square \square \square}$ want explicit, positive formula (eg counting paths in graph)

5. Affine Grassmannians: The graphs P_X look like crystal graphs. Realize this geometrically/construct representations
